

Michaela Langer, CEO, with the Oscar award in the middle,  
on the right Céline Vignaud, Associate Director

On February 9, TrisKem International, received the 'Oscar d'Ille et Villaine' award for International Development during a festive ceremony in Brittany, France.

TrisKem International is a multicultural French SME company manufacturing highly specific resins for the separation of radionuclides from divers matrices (environmental, bioassay, waste samples, irradiated targets and fuel elements) and for various applications (radiation protection, environmental monitoring, decommissioning, quality control and nuclear medicine). The company is run by Michaela Langer, who obtained her PhD in radiochemistry at the university of Bonn and Céline Vignaud, who has a degree in commercial development and economics.

Triskems technical team is highly appreciated in the international community. It actively participates in working groups of ISO and the French nuclear equipment standardization agency BNEN, and it very gladly shares its competence with the radiochemistry community, through technical support as well as through training (e.g. in IAEA organized trainings and workshops).

This Oscar reinforces TrisKem's determination to continue developing its business worldwide in order to support its R&D projects in new fields of activity, such as radiopharmacy, decontamination of radioactive liquid wastes and effluents as well as the recovery of critical metals.
